# SetEnvSetting

## Overview

This is a very simple utility for setting a single environment variable. It was designed to that workstations could be automatically configured in a script to have new functionality without having to go round and run installers.

## Limitations

There is a deliberate limitation on this application that only environment variables that begin with the characters “CC\_” are permitted. This is to stop misuse of this utility to set other random values that could stop a workstation operating correctly (e.g. by mis-setting PATH for example).

## Command Line

The command line options are simply:

```
setCCEnvSettings <key> <value>
```

where key must begin “CC\_” for example:

```
setCCEnvSetting CC_RESERVE_SERVER_ROOT \\reserve-server\collediacontrol$
```
