## 1 CC\_WS\_Manager\_Update

### 1.1 Introduction

From an original application by David Yates

This application is designed to be run by the workstation manager (BNCS\_WS\_Man.exe) so that it can update itself. The normal update mechanism will fail on some files as they are in use, this application uses a standard Windows installer that will allow the files to be updated during the next re-boot.

### 1.2 Configuration

There are no configuration files required to run this application.

### 1.3 Execution

It is not expected that this will be run manually as the workstation manager checks for new files and runs it if it has changed, thus running it manually may have un-desired effects. The information about when workstation manager last ran the update is stored in the registry.

When run automatically the user will not be prompted for any input, when run manually the user will be prompted for the location of the files to be updated.
