## 1 CC\_Sys\_Check

This document describes the actions of the application called CC-Sys\_Check.exe.

### 1.1 Introduction

CC\_Sys\_Check is optionally run after the installer has completed, it does various tasks including removing old files, updating files etc. depending upon what has changed between versions. This tool only needs to be run when upgrading a system, if done on the server the normal update process for a workstation means that it does not need doing on individual machines.

### 1.2 Configuration

There are no configuration files for this application.

### 1.3 Execution

Upon start-up the application shows a list of tasks that will be performed, the user has the option to manually de-select any tasks that are not required, this is not recommended. Pressing “Go” will cause the tasks to be completed. Each task will report various items of information in the lower half of the screen indicating success or failure.

At the time of writing the tasks undertaken are:-

- Add the string control to buttons.xml.
- Delete old binaries that are no longer used or shipped.
- Remove Colledia Control™ from the QT directory if it exists, this prevent “DLL hell” with DLLs being loaded from random locations.
- Update the alarm configuration files to reflect the changes to the configuration tool structure.

### 1.4 Event Logging

All events that are displayed on the screen are also logged for future reference to the logs folder of the current system in a file called CC-Sys\_Check.txt

## 2 Version Control

Version	Date	Author	Comments
0.1	7/11/2006	Mark Baldry	Initial document created
