1 DesktopBmp

1.1 Introduction

This document describes an application originally written by Chris Gil and David Yates

The application desktopBmp.exe creates an image with useful workstation information on it and sets this to be the Windows desktop display.

1.2 Configuration

This application requires no configuration.

1.3 Operation

Upon start-up the application will create a copy of desktop.png called desktop.bmp, on to this it will paint the workstation number, workstation name and the IP address(es) of the local workstation. The generated file is then set as the wallpaper.

This application is normally automatically called during workstation start-up, but could be manually run if required.
